

graphic file is not sufficient notice. A layered version of the graphic files must be included. There will be additional graphic service charges due to the significant adjustment and test printing required for such color match.

Because we use CMYK printers to create your graphics, 100% reproduction of defined colors is not possible.

7. CMYK vs. RGB

We print using CMYK ink sets, Your files should be created in CMYK color mode. Converting from other modes may distort colors, shapes or images. You will notice that **the extended color gamut that RGB uses is not printable.** The printed version of your file will not match with what you see in RGB on your screen. If you prepare and view your file in CMYK, you will be able to see a much closer representation of how the file will print.

8. Can I use multiple banner displays to create a single Mural effect?

We do not recommend the use of multiple banner displays to try to create a single Mural effect. We do not guarantee that the vertical or horizontal placement between banners will match to achieve such effect. There may also be slight curling after time on banner edges. For mural displays, please see our pop-up displays.
